What are ASBVs and the Sustainable Merino Index?

Australian Sheep Breeding Values are an estimate of an animal's true breeding value based on pedigree and performance recorded information. They are essentially a projection of how that animal's progeny will perform for a range of traits.

Yc_{fw} - ASBVs describe the value of animals' genes for wool weight - a positive ASBV means a genetically heavier-cutting animal.

Ys_l - ASBVs describe the value of animals' genes for staple length measured in mm. Rams with more positive SL ASBVs will produce progeny with longer fibre.

Yw_t - ASBVs describe the animals' genetic merit for growth rate. A positive ASBV means the animal is genetically faster growing.

Yf_{at} - ASBVs describe the value of an animal's genes for fat depth at a constant weight - a negative ASBV means a genetically leaner animal.

Yem_d - ASBVs describe the value of animals' genes for eye muscle depth at a constant weight - a positive ASBV means a genetically thicker-muscled animal, and one that will have slightly more of its lean tissue in the higher-priced cuts.

Sustainable Merino Index - This index is based on a self-replacing production system producing 17-19 micron wool, and selling lambs at post-weaning, off-shears. The wool to meat income ratio of the modelled production system is 46:54.

Sustainable Merino has a strong focus on increasing fleece weight, growth and lean meat yield, and reproduction, whilst maintaining staple strength and fibre diameter. It also focuses on reducing worm egg count, dag and wrinkle. This index is suited to producers with a strong focus on sustainability, particularly those operating in a high rainfall area.

Ridgway has 1 ½, 4 ½ and 5 ½ ewes available for private sale in September.
